

NATURAL GAS GENERATORS

Power After the Storm.

A permanently installed natural gas-powered generator is a sure bet for backup power after a major storm or electrical blackout. The reason: Natural Gas pipelines are buried underground – so high winds and rain don't affect them.

Generators come in a wide array of sizes to power all of your electrical needs within any size home. Combine that with a natural gas range and tank water heater, and your home is a fortress of comfort and security in any weather.

Since your generator will be powered by reliable natural gas pipeline, then refueling is never necessary. And when the power flickers, your generator comes on automatically – you may not even know the difference.
